

# Large scale biodiversity assessment with bird sound

Sunny Tseng, Dexter Hodder, and Ken Otter  
University of Northern British Columbia, BC, Canada, John Prince Research Forest

Advances in autonomous recording units (ARUs) and automatic species identification algorithms (e.g., BirdNET) have enabled broad-scaled acoustic monitoring of bird biodiversity.

We conducted a comprehensive project to compare the species composition detected by ARUs versus human observers. Furthermore, we investigated the monitoring effort required for ARU projects.
